“So you want to work in security?”

If I've learned anything, I've learned that there is no single, standard, or best preparatory path.

Independent of how you acquire it, you'll benefit from having a strong understanding of applied computer science, or how computers and software work.

“So you want to work in security?”

Much of applied computer science is about solving problems with layers of abstraction, and security is often about finding the flawed assumptions in those abstractions... and then figuring out how to best fix (or exploit) them.

<https://www.freecodecamp.org/news/so-you-want-to-work-in-security-bc6c10157d23/>

Conway's Law

Following

Organizations which design systems...
are constrained to produce designs which are copies of the
communication structures of these organizations.

— Melvin Conway (1967)

Single Responsibility Principle — Robert C. Martin

Uncle Bob Martin

@unclebobmartin

Software Craftsman

⌚ iPhone: 56.802658,9.868149 ⚡ cleancoder.com

- ▷ Every module, class, or function should have responsibility over a single part of the functionality provided by the software, and that responsibility should be entirely encapsulated by the class. All its services should be narrowly aligned with that responsibility.
- ▷ Single Responsibility Principle introduced by “Uncle Bob” Martin late 1990s: “each software module should have one and only one reason to change”
- ▷ But... we got it wrong.

Single Responsibility Principle

- ▷ Uncle Bob Martin, 2014 — *The Single Responsibility Principle is about people.*
- ▷ Gather together the things that change for the same reasons.
Separate things that change for different reasons.
- ▷ A change request from the analytics group should not break (or touch) a feature developed for the marketing group and vice versa.

SRP Expresses Conway's Law

- ▷ “The Single Responsibility Principle (SRP) states that each software module should have one and only one reason to change... However it begs the question: *What defines a reason to change?*” — Martin (2014)
- ▷ Different reasons to change come from different parts of the organization
- ▷ “Single responsibility” means “group’s responsibility” rather than “what this piece of code does”

Coupling and Cohesion

- ▷ In the same way that parts of your organization work with each other, structure your software with similar coupling and decoupling
- ▷ Think of responsibilities the way your organization thinks of its responsibilities
- ▷ If one department's feature does not affect people in the other department, any change in the first department makes should not affect the other department — Single *department's* Responsibility Principle

Responsibility by “Actor”

- ▷ Suppose we have a new feature involving signup for a promotion.
- ▷ The Single Responsibility Principle tells us to separate this code from, say, the shopping cart. Later change to promotion signup should not affect (or risk breaking) the shopping cart and vice versa.
- ▷ But there's a deeper separation needed... by actor.

Responsibility by Actor

- ▷ This (example) feature supports **users** who sign up for the promotion
- ▷ This feature also supports **admins** who review reports about the signup's progress
- ▷ Suppose we make a change to the signup page layout to fix a problem caused by the latest Chrome or Android release
- ▷ Do we want to risk breaking the admin reports? Certainly not!

Different Actors, Same Feature, Different Reasons

- ▷ The same feature (promotion signup) contains different reasons to change:
 - ▷ **User** signup changes should not affect (or break) reporting
 - ▷ **Admin** reporting changes do not happen at the same time, or for the same reasons, as user signup changes
- ▷ “Gather together the things that change for the same reasons. Separate the things that change for different reasons.”

Another Important Separation

- ▷ We separate business logic from infrastructure
- ▷ But the infrastructure itself has layers and separations
 - ▷ The Model-View-Controller (MVC) pattern is a system of separations
 - ▷ Errors, Exceptions, and Logging have layers of abstraction on top of the native PHP functionality

Errors, Exceptions, and Logging

- ▷ Different frameworks, with different philosophies or emphasis, provide abstractions that “wrap” the native PHP functionality
- ▷ Learn the native PHP functionality so you can understand each abstraction’s intent
- ▷ The PHP community recognizes these problems:
 - ▷ PHP The Right Way <https://phptherightway.com/>
 - ▷ PHP Framework Interoperability Group <https://www.php-fig.org/>

PHP The Right Way

The screenshot shows the homepage of the [PHP The Right Way](https://phptherightway.com) website. The page features a large title "PHP The Right Way" in blue serif font at the top center. Below it is a subtitle "The Right Way". A banner in the top right corner says "Fork me on GitHub". A "SHARE ON TWITTER" button is located below the title. The main content area is organized into several sections:

- Welcome**: Translations, How to Contribute.
- Getting Started**: Use the Current Stable Version (7.4), Built-in Web Server, Mac Setup, Windows Setup, Common Directory Structure.
- Code Style Guide**
- Language Highlights**: Programming Paradigms, Namespaces, Standard PHP Library, Command Line Interface, Xdebug.
- Dependency Injection**: Basic Concept, Complex Problem, Containers, Further Reading.
- Databases**: MySQL Extension, PDO Extension, Interacting with Databases, Abstraction Layers.
- Templating**: Benefits, Plain PHP Templates, Compiled Templates, Further Reading.
- Errors and Exceptions**: Errors, Exceptions.
- Servers and Deployment**: Platform as a Service (PaaS), Virtual or Dedicated Servers, Shared Servers, Building Your Application.
- Virtualization**: Vagrant, Docker.
- Caching**: Opcode Cache, Object Caching.
- Documenting your Code**: PHPDoc.
- Resources**: From the Source, People to Follow, Mentoring, PHP PaaS Providers.

A red arrow points from the "Getting Started" section towards the "Dependency Injection" section. Another red arrow points from the "Language Highlights" section towards the "Errors and Exceptions" section.

PHP Framework Interoperability Group (FIG)

The screenshot shows the official website for the PHP Framework Interop Group (FIG) at <https://www.php-fig.org>. The page has a dark header with the PHP-FIG logo and navigation links for Home, Blog, PSRs, Personnel, Bylaws, FAQs, and Get Involved. Below the header is a large green banner with the text "Moving PHP forward through collaboration and standards." and a welcome message about the group's goal to improve interoperability between PHP projects. At the bottom, there are two buttons: "View recommendations (PSRs)" and "Frequently asked questions". The main content area features sections on AUTOLOADING and PSR-0, each with a brief description and a code snippet.

Home Blog PSRs Personnel Bylaws FAQs Get Involved

Moving PHP forward through collaboration and standards.

Welcome to the PHP Framework Interop Group! We're a group of established PHP projects whose goal is to talk about commonalities between our projects and find ways we can work better together.

[View recommendations \(PSRs\)](#) [Frequently asked questions](#)

AUTOLOADING

Autoloaders remove the complexity of including files by mapping namespaces to file system paths.

```
<?php  
use Vendor\Package\ClassName;  
$object = new ClassName();
```

PSR-12 Style: Ease Sharing Code Between Authors

PSR-12: Extended Coding Style

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC 2119](#).

Overview

This specification extends, expands and replaces [PSR-2](#), the coding style guide and requires adherence to [PSR-1](#), the basic coding standard.

Like [PSR-2](#), the intent of this specification is to reduce cognitive friction when scanning code from different authors. It does so by enumerating a shared set of rules and expectations about how to format PHP code. This PSR seeks to provide a set way that

PSR-3: Logger Interface

This document describes a common interface for logging libraries.

The main goal is to allow libraries to receive a `Psr\Log\LoggerInterface` object and write logs to it in a simple and universal way. Frameworks and CMSs that have custom needs MAY extend the interface for their own purpose, but SHOULD remain compatible with this document. This ensures that the third-party libraries an application uses can write to the centralized application logs.

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC 2119](#).

The word `implementor` in this document is to be interpreted as someone implementing the `LoggerInterface` in a log-related library or framework. Users of loggers are referred to as `user`.

Errors and Exceptions

Inspired by “PHP The Right Way”

https://phptherightway.com/#errors_and_exceptions

Errors and Exceptions

- ▷ In many exception-based languages, when something goes wrong an exception is thrown
- ▷ That's not true for PHP
- ▷ We added exceptions to PHP with PHP 5 (if I recall aright)

Errors and Exceptions

- ▷ Many of the PHP built-in libraries were written prior to PHP 5
 - ▷ These libraries generally return FALSE for failure or error
 - ▷ Based on how C libraries worked
- ▷ Error/failure handling is gloriously inconsistent throughout PHP

How Might We Explore Errors and Exceptions?

- ▷ With unit tests!
- ▷ We can even keep the explorations as part of the code base if it makes sense to do so — they document behavior

First Step - Always

- ▷ Write a test that fails
- ▷ Ensure that it DOES fail
- ▷ This proves to yourself that you have your test harness set up correctly

The screenshot shows a PHPStorm interface with three tabs at the top: 'ExploreErrorTest.php' (active), 'SingletonTest.php', and 'SingletonPro'. The code editor displays 'ExploreErrorTest.php' containing the following code:

```
<?php
declare(strict_types=1);

namespace App\Test\TestCase\Exception;

use PHPUnit\Framework\TestCase;

class ExploreErrorTest extends TestCase
{
    public function testFail(): void
    {
        static::fail(__FUNCTION__);
    }
}
```

A red arrow points from the line 'static::fail(__FUNCTION__);' in the code editor to the word 'testFail' in the test results window below. Another red arrow points from the same line in the code editor to the file path in the test results window.

The test results window shows:

- Tests failed: 1, passed: 19 of 20 tests - 141ms
- Testing started at 6:49 PM ...
- /usr/local/opt/php@7.3/bin/php /Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/vendor/phpunit/phpunit/php
- PHPUnit 8.5.3 by Sebastian Bergmann and contributors.
- testFail
- /Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/tests/TestCase/Exception/ExploreErrorTest.php:12

At the bottom, it says:

Time: 217 ms, Memory: 14.00 MB

FAILURES!

Tests: 20, Assertions: 36, Failures: 1.

Process finished with exit code 1

Notice Error

```
10  public function testUndefined(): void
11  {
12
13      $a = $foo;
14  }
```

» **Tests passed: 20 of 20 tests - 177 ms**

Testing started at 6:56 PM ...

/usr/local/opt/php@7.3/bin/php /Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/vendor/phpunit/phpunit/phpunit --c
PHPUnit 8.5.3 by Sebastian Bergmann and contributors.

Notice Error: Undefined variable: foo

In [/Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/tests/TestCase/ErrorException/ExploreErrorTest.php, line 12]

Time: 285 ms, Memory: 14.00 MB

OK (20 tests, 36 assertions)

Process finished with exit code 0

Notice Errors Mostly Ignored

- ▷ PHP will generally ignore a notice error and continue on
- ▷ Depends on server configuration
- ▷ PHP processing continues even though we now have corrupt or uninitialized data
- ▷ Watch for notice errors in your dev environment and **FIX THEM**

Error Severities

32

- ▶ E_NOTICE, E_WARNING, E_ERROR
- ▶ Other errors exist such as “this feature is deprecated”
- ▶ Turn on E_STRICT to find places code should be improved
- ▶ Use error_reporting() to change error levels being reported

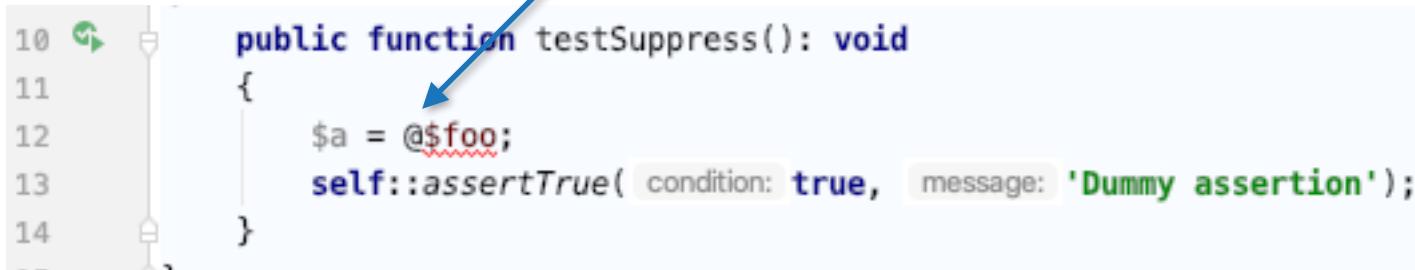

```
10 public function testUndefined(): void
11 {
12     error_reporting( level: 0 );
13     $a = $foo;
14     self::assertTrue( condition: true, message: 'Dummy assertion' );
15 }
```

```
>> ✓ Tests passed: 20 of 20 tests – 192 ms
Testing started at 7:07 PM ...
/usr/local/opt/php@7.3/bin/php /Us
PHPUnit 8.5.3 by Sebastian Bergman
Time: 284 ms, Memory: 14.00 MB
OK (20 tests, 36 assertions)
Process finished with exit code 0
```

Inline Error Suppression - Don't Do This!

33

- ▶ Place an @ character in front of the expression
- ▶ This suppresses any error from being emitted by that expression — it won't be logged anywhere
- ▶ Remarkably bad idea to cover up errors — but you may see it in existing PHP code

```
10 public function testSuppress(): void
11 {
12     $a = @$foo;
13     self::assertTrue( condition: true, message: 'Dummy assertion' );
14 }
```

```

The Traceback Trick

- ▷ When I am trying to trace through PHP code, sometimes I can't tell what chain events got to that code
- ▷ I can throw an exception and examine the backtrace
- ▷ Like this...

Place the mysterious call inside try / catch

- ▷ We want to trace assertTrue()

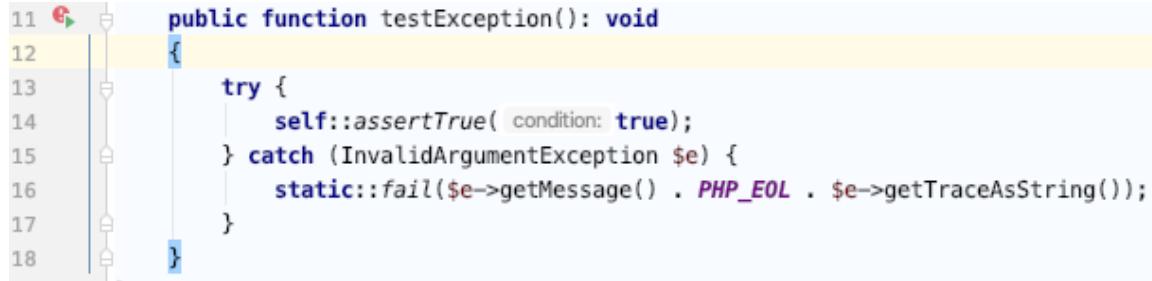

```
9  class ExploreErrorTest extends TestCase
10 {
11     public function testException(): void
12     {
13         try {
14             self::assertTrue( condition: true); ←
15         } catch (InvalidArgumentException $e) {
16             static::fail($e->getMessage() . PHP_EOL . $e->getTraceAsString());
17         }
18     }
19 }
```

Throw exception inside code you need to trace

- Here is assertTrue(), line 1539 in one of the PHPUnit files

```
1535 * @throws |SebastianBergmann|RecursionContext|InvalidArgumentException
1536 *
1537 * @psalm-assert true $condition
1538 */
1539 public static function assertTrue($condition, string $message = ''): void
1540 {
1541     throw new \InvalidArgumentException( message: 'Midwest PHP')];
1542     static::assertThat($condition, static::isTrue(), $message);
1543 }
1544 /**
1545 * Asserts that a condition is not true.
1546 *
1547 */
```

Run the Code

```
11 public function testException(): void
12 {
13     try {
14         self::assertTrue( condition: true);
15     } catch (InvalidArgumentException $e) {
16         static::fail($e->getMessage() . PHP_EOL . $e->getTraceAsString());
17     }
18 }
```

Testing started at 7:44 PM ...

```
/usr/local/opt/php@7.3/bin/php /Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/vendor/phpunit/phpunit --configuration /Users/edwardbarnard/PhpstormProjects/DesignPattern/design-pattern/.phpunit.xml
```

PHPUnit 8.5.3 by Sebastian Bergmann and contributors.

Midwest PHP

Logging

This will be quick

So Many Options!

- ▷ Why are we logging?
- ▷ Who consumes the logs?
- ▷ Performance considerations
- ▷ Sanitized/sensitive data

“Proper” Logging

- ▷ Looks complicated
- ▷ Unnecessary (in my view) learning curve
- ▷ Let your framework simplify
- ▷ Entire companies are built on log file analysis
